Application No. 10/809,339 Amendment dated May 23, 2006

Reply to Office Action of March 16, 2006

AMENDMENTS TO THE CLAIMS

1. (Original) A time measurement system for measuring the delay between first and second signals, the system comprising event-detection means for providing event data representing the times of upcrossings when the first signal crosses a predetermined level with a positive slope and the times of downcrossings when the first signal crosses said predetermined level with a negative slope, and delay-determining means operable to use the event data to define respective staggered segments of the second signal associated with said upcrossings and downcrossings, to sum said segments and to detect a predetermined feature in said sum, the position of said feature representing the delay between the first and second signals.

- 2. (Original) A system as claimed in claim 1, wherein the predetermined level differs significantly from the average value of the first signal.
- 3. (Currently Amended) A system as claimed in claim 1-or-2, including a wireless communication link operable to transmit said event data to said delay-determining means.
- 4. (Original) A system as claimed in any preceding claim, wherein said feature is a peak, the extreme value of which has a position representing the delay.
- 5. (Original) A system as claimed in claim 4, including means responsive to the amplitude of said extreme value for providing a signal indicative of the reliability of the measured delay.
- 6. (Currently Amended) A object detection system comprising a time measurement system as claimed in any preceding claim one of claims 1-3 for measuring a delay associated with a signal received from an object to enable calculation of the range or bearing of the object.
- 7. (Original) An object detection system as claimed in claim 6, comprising a signal generator for generating said first signal, an interrogating signal transmitter for transmitting an interrogating signal derived from said first signal and a receiver for receiving a reflection of the interrogating signal from an object and for generating said second signal in response thereto.

Application No. 10/809,339 Amendment dated May 23, 2006

Reply to Office Action of March 16, 2006

8. (Original) An object detection system as claimed in claim 7, including means

defining a substantially zero-delay signal path between the event-detection means and the delay-

determining means, to enable detection of a zero-delay point, the delay determining means being

operable to calculate said delay from the relative position of said feature and the zero-delay

point.

9. (Original) An object detection system as claimed in claim 6, including first and

second receivers for receiving signals from an object and, in response thereto, generating said

first and second signals.

10. (Original) A time measurement system for measuring the delay between first and

second signals appearing at locations which are remote with respect to each other, comprising a

device at each said location and a wireless communication link therebetween, at least a first

device being operable to transmit via said link event data representing the times at which

predetermined events occur within the first signal, and at least a second device being operable to

receive the event data, to use the event data to define respective staggered segments of the

second signal, to combine said segments and to detect a predetermined feature in said

combination, the position of said feature representing the delay between the first and second

signals.

11. (Original) A method of measuring the shift between first and second signals, the

method comprising determining the events at which the first signal level rises above and falls

below a predetermined threshold level which differs significantly from the average value of the

first signal, combining segments of the second signal which are staggered by the intervals

between said events, and detecting the position within the combination of a peak value, said

position representing said shift.
